Comments

The passenger compartment of the Mitsubishi Eclipse Cross remained stable in the frontal offset test. Dummy readings indicated good protection of the knees and femurs of both the driver and the front seat passenger. Mitsubishi showed that a similar level of protection would be provided to occupants of different sizes and to those sitting in different positions. Protection of the driver's chest was rated as marginal, based on dummy readings of compression. Analysis of the deceleration of the impact trolley during the test, and analysis of the deformable barrier after the test, revealed that the Mitsubishi Eclipse Cross would be a moderately benign impact partner in a frontal collision. In the full-width rigid barrier test, protection was good for all critical body regions of the rear seat passenger. Protection of the driver's chest was marginal but was good for other critical body areas. In both the side barrier test and the more severe side pole impact, good or adequate protection was provided to all critical body areas. Control of excursion (the extent to which a body is thrown to the other side of the vehicle when it is hit from the far side) was found to be marginal The Mitsubishi Eclipse Cross has a countermeasure to mitigate against occupant-to-occupant injuries in such impacts. The airbag performed well in Euro NCAP's tests with dummy readings indicating good protection for both the driver and passenger. Tests on the front seats and head restraints demonstrated good protection against whiplash injuries in the event of a rear-end collision. A geometric analysis of the rear seats also indicated good whiplash protection. The car has an advanced eCall system which alerts the emergency services in the event of a crash, and a system to prevent secondary impacts after the car has been in a collision. Mitsubishi demonstrated that the doors would be openable to allow occupants to escape in the event of vehicle submergence.

Comments

In the frontal offset test, protection of the 6 year dummy was good for all critical body areas and good or adequate for the 10 year dummy. In the side barrier impact, protection of all critical parts of the body was good for both the 6 and 10 year dummies. The front passenger airbag can be disabled to allow a rearward-facing child restraint to be used in that seating position. Clear information is provided to the driver regarding the status of the airbag and the system was rewarded. The Mitsubishi Eclipse Cross is not equipped with 'child presence detection', a system which can alert others if children have been left in the car. All of the child restraint types for which the Mitsubishi Eclipse Cross is designed could be properly installed and accommodated in the car.

22.1 / 27 Pts

System Name	Active Emergency Braking System
Type	Auto-Brake with Forward Collision Warning
Operational From	8 km/h

PERFORMANCE |

AEB Pedestrian

6.5 / 9 Pts

Scenario	Day time	Night time
Car reversing into adult or child		–
Adult crossing a road into which a car is turning		–
Adult crossing the road		
Child running from behind parked vehicles		
Adult along the roadside		

– Currently not tested

AEB Cyclist

7.6 / 8 Pts

Scenario	Day time
Approaching cyclist crossing from behind parked vehicles	
Turning across path of an oncoming cyclist	
Approaching a crossing cyclist	
Approaching a cyclist along the roadside	

Version 271125

VULNERABLE ROAD USERS

Total 51.7 Pts / 82%

GOOD ADEQUATE MARGINAL WEAK POOR

Cyclist Dooring Prevention

0.0 / 1 Pts

Scenario	
Dooring a passing cyclist	

AEB Motorcyclist

6.0 / 6 Pts

Scenario	Autobrake function only	Driver reacts to warning
Approaching a stationary motorcyclist		
Approaching a braking motorcyclist		
Turn across the path of an oncoming motorcyclist		–

– Currently not tested

Lane Support Motorcyclist

2.0 / 3 Pts

Scenario	Day time
Changing lane across the path of an oncoming motorcyclist	
Changing lane across the path of an overtaking motorcyclist	

Comments

Protection of the head of a struck pedestrian or cyclist was largely good or adequate, with poor results recorded on the stiff windscreen pillars and at the base of the screen. Protection of the pelvis was good or adequate at all test locations. Protection of the femur was mixed, but that of the knee and tibia was good at all test locations The autonomous emergency braking system of the Mitsubishi Eclipse Cross responds to vulnerable road users such as pedestrians and cyclists, as well as to other vehicles. In tests of its response to pedestrians, the system performed adequately but provides no protection for those to the rear of the car. The system performed well in tests of its reaction to cyclists but does not protect against 'dooring', where a door is opened into the path of a cyclist approaching from behind. The system's response to motorcyclists was good.

System Name	Active Emergency Braking System
Type	Autonomous emergency braking and forward collision warning
Operational From	7 km/h
Sensor Used	camera and radar

Scenario	Autobrake function only	Driver reacts to warning
Approaching a car crossing a junction		
Approaching a car head-on		–
Turning across the path of an oncoming car		–
Approaching a stationary car		
Approaching a slower moving car		–
Approaching a braking car		–

– Currently not tested

Version 271125

SAFETY ASSIST

Total 12.7 Pts / 70%

Comments

Overall, the performance of the autonomous emergency braking (AEB) system was adequate in tests of its reaction to other vehicles. A seatbelt reminder system is fitted as standard to the front and rear seats. The car has an indirect driver status monitoring system as standard, detecting driver fatigue but not distraction. The lane support system gently corrects the vehicle's path if it is drifting out of lane and also intervenes in some more critical situations. The speed assistance system identifies the local speed limit. The driver can choose to allow the limiter to be set automatically by the system.
